PLAIN-LANGUAGE GUIDE

CLTH.Y — User Journey & Build Story

Written 22 October 2026

What CLTH.Y is

CLTH.Y is a website where you upload four photos of yourself, and it tells you which colours suit you, then shows real outfits from online stores — in stock, inside your budget, and tried on your own photo.

Think of it as a personal colour consultation (the Korean style) followed by a personal shopper. It lives at clthy.vercel.app, and the code is on GitHub.

The journey, screen by screen

A person goes from a first photo to a try-on of their chosen outfit in seven steps.

1. **Home.** A calm page with a flip book of fabric swatches turning through colours, one "Begin" button and a link to the methodology page.
2. **Intake, part A — photos.** Four slots: front face, left side, right side, full body. Each shows an example photo of the pose. You can open a live camera (with flip and a 5-second timer) or upload a file.
3. **Intake, part B — about you.** Height, weight, age, gender, the stores you shop on, a budget slider from ₹1,500 to ₹50,000, an occasion (pick one or choose "Others" and type your own), custom fit wishes, and three optional undertone questions: wrist veins, sun reaction, gold or silver jewellery.
4. **Analysing.** A scanning screen with a progress ring that keeps moving while the AI works, about 25–40 seconds.
5. **Your report.** Your skin-tone reading, your colour season, 6 power colours and 6 colours to avoid, then a dropdown to explore one topic at a time (colours, face, body, fabrics, finishing touches) in plain words. You can download it as a PDF or JSON. A "Confirm & Style Me" button unlocks styling.
6. **Wardrobe Hub.** Complete outfits (top, bottom, shoes) made for your occasion and inside your budget. Every piece is in stock and has a link straight to that exact item. You can also type a request in your own words.
7. **Try-on.** Opening a look automatically puts those exact items on your own full-body photo against a white background. A lookbook page saves the looks you like and prints as a PDF.

What happens behind the scenes

The colours are worked out from measurements and simple rules, not from the AI's imagination; the AI is used for looking, writing and shopping.

STEP	IN EVERYDAY WORDS
Your photos	Stay in your browser. They are sent to the AI only when you run the analysis, and are not kept on the server.
Skin tone	The computer finds your face and reads the real colour of your skin from the pixels, then averages your face photos.
Undertone (warm or cool)	A vote of six clues: skin, eyes, hair, plus your three optional answers. Most votes win; a close vote means "neutral".
Colour season	Your depth (light to deep), contrast (hair and eyes against skin) and softness place you on one of 12 seasons, such as Soft Autumn or Bright Winter.
Power colours	Taken from a fixed palette for your season, so the same photos always give the same colours.
The detailed report	The AI describes what it sees (hair, eyes, face shape, body frame) and fills in the 22-row colour-and-style matrix you supplied, in plain words.
Outfit design	A stronger AI first thinks about what your occasion really needs (for an airport: comfort, easy layers, slip-on shoes), then designs looks to match, within your budget.
Finding real items	A search is run for every top, bottom and pair of shoes. Only product pages that really appeared in the search are accepted.
Stock and price check	Each page is opened and checked: sold-out items are dropped, the real price is read, and a look over budget is swapped to cheaper in-stock alternatives or dropped.
Try-on	An image AI receives all four of your photos plus the store photos of the chosen items, and draws you wearing them. Stock is re-checked first; a sold-out item is swapped for an alternative.

Everything we built, in order

All of this was built in one working session; every step is recorded in the project file steps.md.

1. **The first version.** A website with eight screens (home, intake, analysing, report, wardrobe, try-on, studio, lookbook), a luxury cream-and-wine look, and a small server. Everything ran on example data.
2. **One folder.** The separate website and server folders were merged into one project with one install and one start command.
3. **Real AI analysis.** Your photos are sent to an AI that acts as a Korean colour-analysis master and writes the report. The AI service was later switched to OpenRouter, using Google Gemini models.
4. **Real outfits with real links.** The AI designs looks, searches the chosen stores, and only keeps items whose product page truly appeared in the search. No made-up or search-page links.

5. **Camera and photos.** Four slots with example poses, a live in-browser camera with a timer, and photos kept private in your browser.
6. **Intake clean-up.** Location text, budget tier and style genres removed; an "Others" occasion where you type your own.
7. **Your matrix drives the analysis.** The 22-row feature matrix from your PDF is copied exactly and used for the report, the 18-point summary sheet, and a separate methodology page.
8. **Easier to read.** The long report became a dropdown showing one topic at a time with plain-language cards.
9. **Accurate colours.** Colours are computed from your measured skin tone, a six-clue undertone vote (following the YouTube video you shared) and the 12-season wheel. Results are now repeatable and saved per photo set.
10. **Stock, budget and occasion.** Out-of-stock items are removed and swapped for alternatives, looks stay within your ₹1,500–₹50,000 budget, and the AI plans around what the occasion truly needs (for example airport comfort).
11. **Real try-on.** The exact items from the links are drawn on your own full-body photo against white, and the analysing wait is shorter.
12. **A calmer home page.** A minimal, salon-style page with an animated swatch book of plain fabric cards (no brand names); Mix & Match Studio was removed.
13. **Hosting.** The site is live on Vercel and the code is on GitHub.

Where things live and how to use them

WHAT	WHERE
The live website	clthy.vercel.app
The code	github.com/zalakgogri/Clth.y
The methodology page	clthy.vercel.app/methodology
The project folder on your Mac	/Users/zalakgogri/Clthy (the full build log is steps.md inside it)
The AI account	OpenRouter credits

To try it yourself: open the site, press Begin, add your four photos in daylight with no filter, fill in your details (the three undertone questions help), run the analysis, read your report, press Confirm & Style Me, and open any look to see it on you.

To run it on your own computer, copy .env.example to .env, put your OpenRouter key in it, then run npm install and npm run dev.

Honest limits and what you need to do

> The AI account is almost out of credit, so the live site will fail at analysing, looking for outfits and trying on until you add some.

- **Add credit first.** About $0.40 of the $60 was left at the last check. Top up at openrouter.ai/settings/credits. A full outfit search and a try-on image each cost real money.
- **Stock checks only work on some stores.** Tata CLiQ can be checked live from the website. Myntra shows a maintenance page to the website's server, and H&M, Ajio and Zara block automated checks, so the live site mainly shows Tata CLiQ items. A tick box adds the others, but they may be sold out. Running the app on your own computer lets Myntra be checked too.
- **Colours depend on the photo.** Daylight, no filters and no makeup give the best result. A strong filter or coloured light can shift your skin tone. The seasons' palettes are curated references, not an official chart.
- **The try-on is an AI picture.** It is a good guide, not a guarantee of fit. It needs your own full-body photo.
- **Some checks cannot be done from a photo.** Drape tests with real cloth are estimated, and the report says how confident it is.
- **The YouTube Short you shared** has almost no spoken content, so only the long video was used for the colour method.
